Press Kit CCGK Design :

"Lava stone is a natural material that forms when the magma river released by the volcano cools down.

Through the process of extracting this stone, more than 30 cm of the softer perforated surface is being cut out and disposed of as waste.

At CCGK Design, a studio for architecture and interior design that is founded and based in Dubai, we focus on the issue of environment sustainability and Zero-waste when using natural materials, through research and experiment in contemporary innovative design. We endeavor to unite our creativity in design with high craftsmanship and passionate artisans as yet another form of social sustainability.

In collaboration with Made A Mano, the specialized manufacturers of the lava stone of the volcano Etna in Sicily, lead by its founder, CEO, and art director Rosario Parrinello, we created Amoeba LT (lava table), and Amoeba LL (lava light), a product that explores the concept of re-using this wasted material in its natural form and transforming it into bespoke, luxurious pieces of furniture.

We are also presenting "Round Zero" by Elli Design, a product made of recycled plastic and lava stone, that speaks a new green innovative language, using advanced digital fabrication technology and high craftsmanship seeking solutions for a better Earth.

Together, we proudly mark our second participation at this remarkable event: Downtown Design Editions 2023."
